The invention relates to ex vivo expansion of stem cells, comprises culturing stem cells with a growth medium comprising a chimaera protein, and harvesting the cultured stem cells. The chimaera is based on a mutated human interleukin-3 [IL.3] sequence coupled to a haematopoietic factor (e.g. GW-CSF (colony stimulating factor), CSF-1, G-CSF, G-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ex vivo expansion of stem cells, for enhancing transduction efficiency of cultured stem cells, comprises culturing stem cells in growth medium having mutant interleukin-3, and hematopoietic factor, and harvesting

The invention relates to a novel method whereby stem cells are ex vivo expanded via culturing the stem cells with a growth medium comprising a chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antianaemic, immunostimulant, immunomodulator, antiinflammatory, dermatological, immunosuppressive, cytostetic and heuroprotective applications and may be useful to target hasmopoietic cells for gene therapy, preferably for treating patients having a haemopoietic disorder characterised by decreased levels of system. The expanded ex vivo cells may be used to treat neutropenia, aplastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, aplastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, myelofibrosis. The current sequence is that of a DNA related to the human interleukin-3 (IL-3) mutant protein of the invention.

An expression plasmid contg. the DNA is prepd. and used to transform E.coli. The transformant is cultured and MPGMCSF is produced into the medium. hGMCSF stimulates the granulocyte macrophage system stem cell and promotes the formation of the granulocyte macrophage. hGMCSF is used in curing leukopeania caused by radiation therapy, or chemical therapy, or in promptly propagating leukocytes after bone marrow transplantation. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic DNA encoding human granulocyte colony stimulating factor (GM-CSP), see corresp. AAP90115. Has useful restriction sites for: HindIII; BspMI; NocI; BstEII; BsmI; EcoRV; BgII; ApaI; Ball; XmnI; BamHI; and EcoRI. Used to facilitate cassette mutagenesis of selected regions. Synthesised by phosphoramidite chemistry, by dividing desired gene into 18 oligomers. (Updated on 25-MAR-2003 to correct PA field.)

RI-RE, RE-RI, RI-LE, TO TRI-RI, where RI is a mutant or variant of human interleukin-3 (hIL-3), R2 is a second colony stimulating factor (CSF) including cytokine, 1ymphokine, interleukin, hematopoietic growth factor or IL-3 variant, and L is a linker. Generic sequences are described in AAW03235 - AAW03242, and specifically claimed examples are shown in comparing the present sequences are shown in AAR79342-FR9345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA sequences (including the present sequence) which encode these proteins care shown in AAQ97167-097204 and AAQ97222-097237. The fusion protein is used to increase haematopoietic cell production. It is also useful as an IL-3 antagonist or as a discrete antigenic fragment for production of antibodies useful in immunoassays and immunotherapy. Antagonists are used to block the growth of certain cancer cells and in treatment of sathma.

CThe fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion; and to treat diseases characterised by decreased levels of myeloid, erythroid, lymphoid and/or megakaryocyte cells of the haematopoietic system. The protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        498

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multivariant IL-3 Hematopoiesis Fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 6

US-08-469-318-176

Sequence 176, Application US/08469318

Patent No. 6022535

GENERAL INFORMATION:

APPLICANT:

TITLE OF INVENTION: Protein

NUMBER OF SEQUENCES: 196

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

COMPUTER: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30 (EPO)

/ note="Organ: lung: Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NOT_CGAP_LuS was prepared, and ss circles were made in virro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1417991 and 1520904-1522439). Subtraction by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AlaSerHisTyrLysGlnHisCysProProThrProGluThrSerCysAlaThrGlnIle 115

CDNA was synthesized from poly(A)+ mRNA using the template-switching PCR method (SNART DNA Kit, BD Bloosiences). First strand CDNA was reverse transcribed using the CDS III/3' primer and a 5' template switch primer (Snart IV primer). The product of the first strand synthesis was PCR amplified using the same primer set and the fragments were digested with Sfil. The fragments were size selected, ligated into a modified pBluescript wector (obtained from Michael White, Montana State University) containing directional Sfil sites, and electroporated into ElectroTen Blue cells. Vector: Sfil sites were added to the multiple cloning region of pBluescript SK+ between the BamHi/EcoRi sites. The modified polylinker has the BamHi/EcoRi sites. The modified polylinker has the BamHi/EcoRi sites.

(Pharmacia) with a modified polylinker; Site_1: ECOR I;
Site_2: Not I; NCI CGAP_FL1 is a normalized CDNA library
derived from a pool of mRNA obtained from 4 cell lines
from grade III chondrosarcoma tissues. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand CDNA
synthesis was primed with an oilgo-dr primer containing a
Not I site. Double stranded cDNA was ligated to an ECOR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector. The oilgonuclecitde used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
(dT)18 tail. The sequence tag for this library is
GAGGTCGGTG. The cell lines were provided by Dr. James
Martin from the University of Iowa.

NCI_CGAP_FTI is a normalized compliant Macrophage challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 3 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 3 hours; Rebsiella moi 10, 24 hours; Rebsiella moi 10, 3 hours; Rebsiella moi 10, 24 hours; Adenoviral vector (AdS CMV eGFP), moi 500, 24 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 24 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 24 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 24 hours; Adenovirus moi 500, 3 hours; Adenovirus moi 500, 24 hours; Adenovirus moi 500, 3 hours; wt adenovirus + LPS 24 hours; Adenovirus moi 500, 24 hours; Adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; Adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt ad

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "
